1. An equation like \( \sin^2 \theta + \cos^2 \theta = 1 \) is called an identity because it holds for all values of \( \theta \). An equation like \( \sin \theta = 0.5 \) is not an identity because it holds only for selected values of \( \theta \), not all. If you differentiate both sides of a trigonometric identity in \( \theta \) with respect to \( \theta \), the resulting new equation will also be an identity.

Differentiate the following to show that the resulting equations hold for all \( \theta \).

a. \( \sin 2\theta = 2 \sin \theta \cos \theta \)

b. \( \cos 2\theta = \cos^2 \theta - \sin^2 \theta \)

2. If the identity \( \sin (x + a) = \sin x \cos a + \cos x \sin a \) is differentiated with respect to \( x \), is the resulting equation also an identity? Does this principle apply to the equation \( x^2 - 2x - 8 = 0 \)? Explain.

3. a. Find values for the constants \( a \), \( b \), and \( c \) that will make

\[ f(x) = \cos x \quad \text{and} \quad g(x) = a + bx + cx^2 \]

satisfy the conditions

\[ f(0) = g(0), \quad f'(0) = g'(0), \quad \text{and} \quad f''(0) = g''(0). \]
b. Find values for \( b \) and \( c \) that will make
\[
f(x) = \sin(x + a) \quad \text{and} \quad g(x) = b\sin x + c\cos x
\]
satisfy the conditions
\[
f(0) = g(0) \quad \text{and} \quad f'(0) = g'(0).
\]

c. For the determined values of \( a, b, \) and \( c \), what happens for the third and fourth derivatives of \( f \) and \( g \) in each of parts (a) and (b)?

4. Solutions to differential equations

a. Show that \( y = \sin x, y = \cos x, \) and \( y = a\cos x + b\sin x \) (\( a \) and \( b \) constants) all satisfy the equation
\[
y'' + y = 0.
\]

b. How would you modify the functions in part (a) to satisfy the equation
\[
y'' + 4y = 0?
\]

Generalize this result.

5. An osculating circle

Find the values of \( h, k, \) and \( a \) that make the circle \( (x - h)^2 + (y - k)^2 = a^2 \) tangent to the parabola \( y = x^2 + 1 \) at the point \((1, 2)\) and that also make the second derivatives \( d^2y/dx^2 \) have the same value on both curves there. Circles like this one that are tangent to a curve and have the same second derivative as the curve at the point of tangency are called osculating circles (from the Latin osculari, meaning “to kiss”). We encounter them again in Chapter 13.

6. Marginal revenue

A bus will hold 60 people. The number \( x \) of people per trip who use the bus is related to the fare charged \( (p \text{ dollars}) \) by the law \( p = [3 - (x/40)]^2 \). Write an expression for the total revenue \( r(x) \) per trip received by the bus company. What number of people per trip will make the marginal revenue \( dr/dx \) equal to zero? What is the corresponding fare? (This fare is the one that maximizes the revenue, so the bus company should probably rethink its fare policy.)

7. Industrial production

a. Economists often use the expression “rate of growth” in relative rather than absolute terms. For example, let \( u = f(t) \) be the number of people in the labor force at time \( t \) in a given industry. (We treat this function as though it were differentiable even though it is an integer-valued step function.)

Let \( v = g(t) \) be the average production per person in the labor force at time \( t \). The total production is then \( y = uv \).

If the labor force is growing at the rate of \( 4\% \) per year \( (du/dt = 0.04u) \) and the production per worker is growing at the rate of \( 5\% \) per year \( (dv/dt = 0.05v) \), find the rate of growth of the total production, \( y \).

b. Suppose that the labor force in part (a) is decreasing at the rate of \( 2\% \) per year while the production per person is increasing at the rate of \( 3\% \) per year. Is the total production increasing, or is it decreasing, and at what rate?

8. Designing a gondola

The designer of a 30-ft-diameter spherical hot air balloon wants to suspend the gondola 8 ft below the bottom of the balloon with cables tangent to the surface of the balloon, as shown. Two of the cables are shown running from the top edges of the gondola to their points of tangency, \((−12, −9)\) and \((12, −9)\). How wide should the gondola be?

9. Pisa by parachute

The photograph shows Mike McCarthy parachuting from the top of the Tower of Pisa on August 5, 1988. Make a rough sketch to show the shape of the graph of his speed during the jump.

Mike McCarthy of London jumped from the Tower of Pisa and then opened his parachute in what he said was a world record low-level parachute jump of 179 ft. (Source: Boston Globe, Aug. 6, 1988.)
13. Velocity of a particle

A particle of constant mass \( m \) moves along the \( x \)-axis. Its velocity \( v \) and position \( x \) satisfy the equation

\[
\frac{1}{2} m(v^2 - v_0^2) = \frac{1}{2} k(x_0^2 - x^2),
\]

where \( k \), \( v_0 \), and \( x_0 \) are constants. Show that whenever \( v \neq 0 \),

\[
m \frac{dv}{dt} = -kx.
\]

14. Average and instantaneous velocity

a. Show that if the position \( x \) of a moving point is given by a quadratic function of \( t \), \( x = At^2 + Bt + C \), then the average velocity over any time interval \([t_1, t_2]\) is equal to the instantaneous velocity at the midpoint of the time interval.

b. What is the geometric significance of the result in part (a)?

15. Find all values of the constants \( m \) and \( b \) for which the function

\[
y = \begin{cases} 
\sin x, & x < \pi \\
mx + b, & x \geq \pi 
\end{cases}
\]

is

a. continuous at \( x = \pi \).

b. differentiable at \( x = \pi \).

16. Does the function

\[
f(x) = \begin{cases} 
\frac{1 - \cos x}{x}, & x \neq 0 \\
0, & x = 0
\end{cases}
\]

have a derivative at \( x = 0 \)? Explain.

17. a. For what values of \( a \) and \( b \) will

\[
f(x) = \begin{cases} 
ax, & x < 2 \\
ax^2 - bx + 3, & x \geq 2
\end{cases}
\]

be differentiable for all values of \( x \)?

b. Discuss the geometry of the resulting graph of \( f \).

18. a. For what values of \( a \) and \( b \) will

\[
g(x) = \begin{cases} 
ax + b, & x \leq -1 \\
ax^3 + x + 2b, & x > -1
\end{cases}
\]

be differentiable for all values of \( x \)?

b. Discuss the geometry of the resulting graph of \( g \).

19. Odd differentiable functions

Is there anything special about the derivative of an odd differentiable function of \( x \)? Give reasons for your answer.

20. Even differentiable functions

Is there anything special about the derivative of an even differentiable function of \( x \)? Give reasons for your answer.

21. Suppose that the functions \( f \) and \( g \) are defined throughout an open interval containing the point \( x_0 \), that \( f \) is differentiable at \( x_0 \), that \( f(x_0) = 0 \), and that \( g \) is continuous at \( x_0 \). Show that the product \( fg \) is differentiable at \( x_0 \). This process shows, for example, that although \( |x| \) is not differentiable at \( x = 0 \), the product \( x |x| \) is differentiable at \( x = 0 \).

22. (Continuation of Exercise 21.) Use the result of Exercise 21 to show that the following functions are differentiable at \( x = 0 \).

a. \( |x| \sin x \)

b. \( x^{2/3} \sin x \)

c. \( \sqrt{x(1 - \cos x)} \)

d. \( h(x) = \begin{cases} 
x^2 \sin (1/x), & x \neq 0 \\
0, & x = 0
\end{cases} \)

23. Is the derivative of

\[
h(x) = \begin{cases} 
x^2 \sin (1/x), & x \neq 0 \\
0, & x = 0
\end{cases}
\]

continuous at \( x = 0 \)? How about the derivative of \( k(x) = xh(x) \)? Give reasons for your answers.

24. Suppose that a function \( f \) satisfies the following conditions for all real values of \( x \) and \( y \):

i. \( f(x + y) = f(x) \cdot f(y) \).

ii. \( f(x) = 1 + xg(x) \), where \( \lim_{x \to 0} g(x) = 1 \).

Show that the derivative \( f'(x) \) exists at every value of \( x \) and that \( f'(x) = f(x) \).

25. The generalized product rule

Use mathematical induction to prove that if \( y = u_1 u_2 \cdots u_n \) is a finite product of differentiable functions, then \( y \) is differentiable on their common domain and

\[
\frac{dy}{dx} = \frac{du_1}{dx} u_2 \cdots u_n + u_1 \frac{du_2}{dx} u_3 \cdots u_n + \cdots + u_1 u_2 \cdots u_{n-1} \frac{du_n}{dx}.
\]
26. **Leibniz’s rule for higher-order derivatives of products** Leibniz’s rule for higher-order derivatives of products of differentiable functions says that

\[
\frac{d^n(uv)}{dx^n} = \frac{d^n u}{dx^n} v + \sum_{k=0}^{n-1} \frac{n!}{k!(n-k)!} \frac{d^k u}{dx^k} \frac{d^{n-k} v}{dx^{n-k}} + \frac{d^n v}{dx^n} u
\]

**a.** The equations in parts (a) and (b) are special cases of the equation in part (c). Derive the equation in part (c) by mathematical induction, using

\[
\binom{m}{k} + \binom{m}{k+1} = \frac{m!}{k!(m-k)!} + \frac{m!}{(k+1)!(m-k-1)!}.
\]

27. **The period of a clock pendulum** The period \( T \) of a clock pendulum (time for one full swing and back) is given by the formula \( T^2 = 4\pi^2L/g \), where \( T \) is measured in seconds, \( g = 32.2 \text{ ft/sec}^2 \), and \( L \), the length of the pendulum, is measured in feet. Find approximately

\[
\begin{align*}
a. & \quad \text{the length of a clock pendulum whose period is } T = 1 \text{ sec.} \\
b. & \quad \text{the change } dT \text{ in } T \text{ if the pendulum in part (a) is lengthened } 0.01 \text{ ft.} \\
c. & \quad \text{the amount the clock gains or loses in a day as a result of the period's changing by the amount } dT \text{ found in part (b).}
\end{align*}
\]

28. **The melting ice cube** Assume an ice cube retains its cubical shape as it melts. If we call its edge length \( s \), its volume is \( V = s^3 \) and its surface area is \( 6s^2 \). We assume that \( V \) and \( s \) are differentiable functions of time \( t \). We assume also that the cube’s volume decreases at a rate that is proportional to its surface area. (This latter assumption seems reasonable enough when we think that the melting takes place at the surface: Changing the amount of surface changes the amount of ice exposed to melt.) In mathematical terms,

\[
\frac{dV}{dt} = -ks^2, \quad k > 0.
\]

The minus sign indicates that the volume is decreasing. We assume that the proportionality factor \( k \) is constant. (It probably depends on many things, such as the relative humidity of the surrounding air, the air temperature, and the incidence or absence of sunlight, to name only a few.) Assume a particular set of conditions in which the cube lost \( 1/4 \) of its volume during the first hour, and that the volume is \( V_0 \) when \( t = 0 \). How long will it take the ice cube to melt?
