Suppose Show that the angle between $\mathbf{a}$ and $\mathbf{b}$ never changes. What is the angle?

Find the point on the curve where the curvature is greatest.

Find the particle’s highest speed.

Sketch the curve traced by $P$ during the interval $0 \leq t \leq 3$.

Find $\mathbf{v}$ and $\mathbf{a}$ at $t = 0, 1, 2,$ and $3$ and add these vectors to your sketch.

At any given time, what is the forward speed of the topmost point of the wheel? Of $C$?

Projectile Motion and Motion in a Plane

11. Shot put A shot leaves the thrower’s hand 6.5 ft above the ground at a 45° angle at 44 ft/sec. Where is it 3 sec later?

12. Javelin A javelin leaves the thrower’s hand 7 ft above the ground at a 45° angle at 80 ft/sec. How high does it go?

13. A golf ball is hit with an initial speed $v_0$ at an angle $\alpha$ to the horizontal from a point that lies at the foot of a straight-sided hill that is inclined at an angle $\phi$ to the horizontal, where

\[ 0 < \phi < \alpha < \frac{\pi}{2}. \]

Show that the ball lands at a distance

\[ \frac{2v_0^2 \cos \alpha}{g \cos^2 \phi} \sin (\alpha - \phi), \]

measured up the face of the hill. Hence, show that the greatest range that can be achieved for a given $v_0$ occurs when $\alpha = (\phi/2) + (\pi/4)$, i.e., when the initial velocity vector bisects the angle between the vertical and the hill.
14. The Dictator  The Civil War mortar Dictator weighed so much (17,120 lb) that it had to be mounted on a railroad car. It had a 13-in. bore and used a 20-lb powder charge to fire a 200-lb shell. The mortar was made by Mr. Charles Knapp in his ironworks in Pittsburgh, Pennsylvania, and was used by the Union army in 1864 in the siege of Petersburg, Virginia. How far did it shoot? Here we have a difference of opinion. The ordnance manual claimed 4325 yd, while field officers claimed 4752 yd. Assuming a 45° firing angle, what muzzle speeds are involved here?

15. The World’s record for popping a champagne cork
   a. Until 1988, the world’s record for popping a champagne cork was 109 ft. 6 in., once held by Captain Michael Hill of the British Royal Artillery (of course). Assuming Cpt. Hill held the bottle neck at ground level at a 45° angle, and the cork behaved like an ideal projectile, how fast was the cork going as it left the bottle?
   b. A new world record of 177 ft. 9 in. was set on June 5, 1988, by Prof. Emeritus Heinrich of Rensselaer Polytechnic Institute, firing from 4 ft. above ground level at the Woodbury Vineyards Winery, New York. Assuming an ideal trajectory, what was the cork’s initial speed?

16. Javelin  In Potsdam in 1988, Petra Felke of (then) East Germany set a women’s world record by throwing a javelin 262 ft 5 in.
   a. Assuming that Felke launched the javelin at a 40° angle to the horizontal 6.5 ft above the ground, what was the javelin’s initial speed?
   b. How high did the javelin go?

17. Synchronous curves  By eliminating α from the ideal projectile equations
   \[ x = (v_0 \cos \alpha)t, \quad y = (v_0 \sin \alpha)t - \frac{1}{2} gt^2, \]
   show that \( x^2 + (y + \frac{gt^2}{2})^2 = v_0^2 t^2. \) This shows that projectiles launched simultaneously from the origin at the same initial speed will, at any given instant, all lie on the circle of radius \( v_0t \) centered at \( (0, -\frac{gt^2}{2}), \) regardless of their launch angle. These circles are the synchronous curves of the launching.

18. Radius of curvature  Show that the radius of curvature of a twice-differentiable plane curve \( r(t) = f(t)i + g(t)j \) is given by the formula
   \[ \rho = \frac{\dot{x}^2 + \dot{y}^2}{\sqrt{\dot{x}^2 + \dot{y}^2 - \ddot{x}^2}}, \quad \text{where} \quad \dot{x} = \frac{dx}{dt}, \sqrt{\dot{x}^2 + \dot{y}^2}. \]

19. Curvature  Express the curvature of the curve
   \[ r(t) = \left( \int_0^t \cos \left( \frac{1}{2} \pi \theta^2 \right) d\theta \right)i + \left( \int_0^t \sin \left( \frac{1}{2} \pi \theta^2 \right) d\theta \right)j \]
   as a function of the directed distance \( s \) measured along the curve from the origin. (See the accompanying figure.)

20. An alternative definition of curvature in the plane  An alternative definition gives the curvature of a sufficiently differentiable plane curve to be \( |d\phi/ds|, \) where \( \phi \) is the angle between \( T \) and \( i \) (Figure 13.40a). Figure 13.40b shows the distance \( s \) measured counterclockwise around the circle \( x^2 + y^2 = a^2 \) from the point \((a, 0)\) to a point \(P\), along with the angle \( \phi \) at \(P\). Calculate the circle’s curvature using the alternative definition. (Hint: \( \phi = \theta + \pi/2. \))

21. \( r(t) = (2 \cos t)i + (2 \sin t)j + \dot{t}k, \quad 0 \leq t \leq \pi/4 \)
22. \( r(t) = (3 \cos t)i + (3 \sin t)j + 2\sqrt{3}k, \quad 0 \leq t \leq 3 \)

In Exercises 23–26, find \( T, N, B, \kappa, \) and \( \tau \) at the given value of \( t. \)

23. \( r(t) = \frac{4}{9}(1 + \rho)^{3/2}i + \frac{4}{9}(1 - t)^{3/2}j + \frac{1}{3}tk, \quad t = 0 \)
24. \( r(t) = (e^t \sin 2t)i + (e^t \cos 2t)j + 2e^t k, \quad t = 0 \)

**Motion in Space**

Find the lengths of the curves in Exercises 21 and 22.
Chapter 13: Vector-Valued Functions and Motion in Space

25. \( \mathbf{r}(t) = ti + e^{2t} j, \quad t = \ln 2 \)

26. \( \mathbf{r}(t) = (3 \cosh 2t)i + (3 \sinh 2t)j + 6t\mathbf{k}, \quad t = \ln 2 \)

In Exercises 27 and 28, write \( \mathbf{a} \) in the form \( a_T\mathbf{T} + a_N\mathbf{N} \) at \( t = 0 \) without finding \( T \) and \( N \).

27. \( \mathbf{r}(t) = (2 + 3t + 3t^3)i + (4t + 4t^3)j - (6 \cos t)\mathbf{k} \)

28. \( \mathbf{r}(t) = (2 + 3t)i + (t + 2t^3)j + (1 + t^3)\mathbf{k} \)

29. Find \( T, N, B, \kappa, \) and \( \tau \) as functions of \( t \) if \( \mathbf{r}(t) = (\sin t)i + \sqrt{2} \cos t)j + (\sin t)\mathbf{k} \).

30. At what times in the interval \( 0 \leq t \leq \pi \) are the velocity and acceleration vectors of the motion \( \mathbf{r}(t) = i + (5 \cos t)j + (3 \sin t)\mathbf{k} \) orthogonal?

31. The position of a particle moving in space at time \( t \geq 0 \) is

\[
\mathbf{r}(t) = 2i + \left( 4 \sin \frac{t}{2} \right) j + \left( 3 - \frac{t}{\sqrt{2}} \right) \mathbf{k}.
\]

Find the first time \( \mathbf{r} \) is orthogonal to the vector \( i - j \).

32. Find equations for the osculating, normal, and rectifying planes of the curve \( \mathbf{r}(t) = ti + t^2j + t^3\mathbf{k} \) at the point \((1, 1, 1)\).

33. Find parametric equations for the line that is tangent to the curve \( \mathbf{r}(t) = e^t i + (\sin t)j + \ln (1 - t)\mathbf{k} \) at \( t = 0 \).

34. Find parametric equations for the line tangent to the helix \( \mathbf{r}(t) = \left( \frac{1}{2} \cos t \right)i + \left( \frac{1}{2} \sin t \right)j + tk \) at the point where \( t = \pi/4 \).

35. The view from Skylab 4

What percentage of Earth's surface area could the astronauts see when Skylab 4 was at its apogee height, 437 km above the surface? To find out, model the visible surface as the surface generated by revolving the circular arc \( GT \), shown here, about the \( y \)-axis. Then carry out these steps:

1. Use similar triangles in the figure to show that \( y_0/6380 = 6380/(6380 + 437) \). Solve for \( y_0 \).

2. To four significant digits, calculate the visible area as

\[
VA = \int_{y_0}^{6380} 2\pi x \sqrt{1 + \left( \frac{dx}{dy} \right)^2} dy.
\]

3. Express the result as a percentage of Earth's surface area.
